Recursion and Conditionals

A **recursive function** is a function that calls itself, and it is useful for **iterative processes** on **inductive data structures**.

Recursion and Conditionals

A **recursive function** is a function that calls itself, and it is useful for **iterative processes** on **inductive data structures**.

Let's define a **recursive function** `sum` that computes the sum of integers from 1 to n in Scala:

```scala
/* Scala */
def sum(n: Int): Int =
  if (n < 1) 0          // base case
  else n + sum(n - 1)   // recursive case

sum(10) // 10 + 9 + 8 + 7 + 6 + 5 + 4 + 3 + 2 + 1 + 0 = 55
```

Recursion and Conditionals

A **recursive function** is a function that calls itself, and it is useful for **iterative processes** on **inductive data structures**.

Let's define a **recursive function** `sum` that computes the sum of integers from 1 to n in Scala:

```
/* Scala */
def sum(n: Int): Int =
  if (n < 1) 0          // base case
  else n + sum(n - 1)   // recursive case

sum(10) // 10 + 9 + 8 + 7 + 6 + 5 + 4 + 3 + 2 + 1 + 0 = 55
```

For recursive functions, we need **conditionals** to define 1) **base cases** and 2) **recursive cases**.

Recursion and Conditionals

Most programming languages support **recursive functions**:

- Scala

```scala
def sum(n: Int): Int = if (n < 1) 0 else n + sum(n - 1)
```

- C++

```cpp
int sum(int n) { return n < 1 ? 0 : n + sum(n - 1); }
```

- Python

```python
def sum(n): return 0 if n < 1 else n + sum(n - 1)
```

- Rust

```rust
fn sum(n: i32) -> i32 { if n < 1 {0} else {n + sum(n-1)} }
```

- ...

Recursion in F1VAE

The F1VAE language already supports **recursive functions**:

```
/* F1VAE */
def sum(n) = n + sum(n + -1);
sum(10)
```

Why?

Recursion in F1VAE

The F1VAE language already supports **recursive functions**:

```
/* F1VAE */
def sum(n) = n + sum(n + -1);
sum(10)
```

Why? The **function environment** Λ stores all the function definitions before evaluating the expressions.

$$\Lambda = [\texttt{sum} \mapsto \texttt{def sum(n) = n + sum(n + -1)}]$$

We can lookup and invoke the function `sum` in its body.

Recursion in F1VAE

The F1VAE language already supports **recursive functions**:

```
/* F1VAE */
def sum(n) = n + sum(n + -1);
sum(10)
```

Why? The **function environment** Λ stores all the function definitions before evaluating the expressions.

$$\Lambda = [\texttt{sum} \mapsto \texttt{def sum(n) = n + sum(n + -1)}]$$

We can lookup and invoke the function `sum` in its body.

However, is it enough to support recursive functions?

Recursion in F1VAE

The F1VAE language already supports **recursive functions**:

```
/* F1VAE */
def sum(n) = n + sum(n + -1);
sum(10)
```

Why? The **function environment** Λ stores all the function definitions before evaluating the expressions.

$$\Lambda = [\texttt{sum} \mapsto \texttt{def sum(n) = n + sum(n + -1)}]$$

We can lookup and invoke the function `sum` in its body.

However, is it enough to support recursive functions?

No! We need **conditionals** to define 1) **base cases** and 2) **recursive cases** for recursive functions. The above example causes an **infinite loop**.

Recursion in F1VAE

If we only add **conditionals** to F1VAE, we can define recursive functions in F1VAE without any more extensions for recursion.

$$\begin{array}{llcll}
\text{Programs} & \mathbb{P} \ni p & ::= & f^* \; e & (\texttt{Program}) \\
\text{Function Definitions} & \mathbb{F} \ni f & ::= & \texttt{def}\; x(x) \;\texttt{=}\; e & (\texttt{FunDef}) \\
\text{Expressions} & \mathbb{E} \ni e & ::= & \ldots & \\
 & & | & e \;\texttt{<}\; e & (\texttt{Lt}) \\
 & & | & \texttt{if}\;(e)\; e \;\texttt{else}\; e & (\texttt{If}) \\
\text{Values} & \mathbb{V} \ni v & ::= & n \mid b &
\end{array}$$

$$\begin{array}{lll}
\text{Function Environments} & \Lambda \in \mathbb{X} \xrightarrow{\text{fin}} \mathbb{F} & (\texttt{FEnv}) \\
\text{Boolean} & b \in \mathbb{B} = \{\texttt{true}, \texttt{false}\} & (\texttt{Boolean})
\end{array}$$

```
/* F1VAE + conditionals */
def sum(n) = if (n < 1) 0 else n + sum(n + -1);
sum(10) // 55
```

$$\Lambda = [\texttt{sum} \mapsto \texttt{def sum(n) = if (n < 1) 0 else n + sum(n + -1)}]$$

Recursion in FAE

```
/* FAE + conditionals */
val sum = n => {
  if (n < 1) 0
  else n + sum(n + -1)
};
sum(10)
```

What happens if we add **conditionals** to FAE? Is the following FAE expression a recursive function?

Recursion in FAE

```
/* FAE + conditionals */
val sum = n => {
  if (n < 1) 0
  else n + sum(n + -1)
};
sum(10)
```

What happens if we add **conditionals** to FAE? Is the following FAE expression a recursive function? **No!** `sum` is a **free identifier**! Why?

Recursion in FAE

```
/* FAE + conditionals */
val sum = n => {
  if (n < 1) 0
  else n + sum(n + -1)
};
sum(10)
```

What happens if we add **conditionals** to FAE? Is the following FAE expression a recursive function? **No!** `sum` is a **free identifier**! Why?

We use **static scoping** for function definitions in FAE. At the definition site, the variable `sum` is not defined in the environment.

Recursion in FAE

```
/* FAE + conditionals */
val sum = n => {
  if (n < 1) 0
  else n + sum(n + -1)
};
sum(10)
```

What happens if we add **conditionals** to FAE? Is the following FAE expression a recursive function? **No!** `sum` is a **free identifier**! Why?

We use **static scoping** for function definitions in FAE. At the definition site, the variable `sum` is not defined in the environment.

Then, how to support recursive functions in FAE? There are two ways:

1. **Without new syntax** – using `mkRec` to define recursive functions
2. **With new syntax** – extending FAE with recursive function definitions

Contents

Recursion without New Syntax in FAE

```
/* FAE + conditionals */
val sum = n => {
  if (n < 1) 0
  else n + sum(n + -1)
};
sum(10)
```

How to let `sum` know itself in its body?

Recursion without New Syntax in FAE

```
/* FAE + conditionals */
val sum = n => {
  if (n < 1) 0
  else n + sum(n + -1)
};
sum(10)
```

How to let `sum` know itself in its body?

Let's pass the function as an argument to itself!

Recursion without New Syntax in FAE

```
/* FAE + conditionals */
val sumX = sumY => {
  n => {
    if (n < 1) 0
    else n + sumY(sumY)(n + -1)
  }
};
sumX(sumX)(10)
```

Recursion without New Syntax in FAE

```
/* FAE + conditionals */
val sumX = sumY => {
  n => {
    if (n < 1) 0
    else n + sumY(sumY)(n + -1)
  }
};
sumX(sumX)(10)
```

However, it is annoying to always pass the function to itself!

Recursion without New Syntax in FAE

```
/* FAE + conditionals */
val sumX = sumY => {
  n => {
    if (n < 1) 0
    else n + sumY(sumY)(n + -1)
  }
};
sumX(sumX)(10)
```

However, it is annoying to always pass the function to itself!

Let's wrap this to get `sum` back!

Recursion without New Syntax in FAE

```
/* FAE + conditionals */
val sum = n => {
  val sumX = sumY => {
    n => {
      if (n < 1) 0
      else n + sumY(sumY)(n + -1)
    }
  };
  sumX(sumX)(n)
};
sum(10)
```

[1] https://en.wikipedia.org/wiki/Lambda_calculus#%CE%B7-reduction

Recursion without New Syntax in FAE

```
/* FAE + conditionals */
val sum = n => {
  val sumX = sumY => {
    n => {
      if (n < 1) 0
      else n + sumY(sumY)(n + -1)
    }
  };
  sumX(sumX)(n)
};
sum(10)
```

We can simplify this using η-**reduction**[1]:

$\lambda x.e(x) \quad \longrightarrow \quad e$ only if x is **NOT FREE** in e.

[1] https://en.wikipedia.org/wiki/Lambda_calculus#%CE%B7-reduction

Recursion without New Syntax in FAE

```
/* FAE + conditionals */
val sum = {
  val sumX = sumY => {
    n => { // ALMOST the same as the original body
      if (n < 1) 0
      else n + sumY(sumY)(n + -1)
    }
  };
  sumX(sumX)
};
sum(10)
```

Recursion without New Syntax in FAE

PLRG

```
/* FAE + conditionals */
val sum = {
  val sumX = sumY => {
    n => { // ALMOST the same as the original body
      if (n < 1) 0
      else n + sumY(sumY)(n + -1)
    }
  };
  sumX(sumX)
};
sum(10)
```

The function body is almost the same as the original version except that we need to call the function as `sumY(sumY)` instead of `sum`.

Recursion without New Syntax in FAE

```
/* FAE + conditionals */
val sum = {
  val sumX = sumY => {
    n => { // ALMOST the same as the original body
      if (n < 1) 0
      else n + sumY(sumY)(n + -1)
    }
  };
  sumX(sumX)
};
sum(10)
```

The function body is almost the same as the original version except that we need to call the function as `sumY(sumY)` instead of `sum`.

Let's define a variable `sum` to be `sumY(sumY)`!

Recursion without New Syntax in FAE

```
/* FAE + conditionals */
val sum = {
  val sumX = sumY => {
    val sum = sumY(sumY);
    n => { // EXACTLY the same as the original body
      if (n < 1) 0
      else n + sum(n + -1)
    }
  };
  sumX(sumX)
};
sum(10)
```

Recursion without New Syntax in FAE

```
/* FAE + conditionals */
val sum = {
  val sumX = sumY => {
    val sum = sumY(sumY); // INFINITE LOOP
    n => { // EXACTLY the same as the original body
      if (n < 1) 0
      else n + sum(n + -1)
    }
  };
  sumX(sumX)
};
sum(10)
```

Unfortunately, this is an **infinite loop**!

Recursion without New Syntax in FAE

```
/* FAE + conditionals */
val sum = {
  val sumX = sumY => {
    val sum = sumY(sumY); // INFINITE LOOP
    n => { // EXACTLY the same as the original body
      if (n < 1) 0
      else n + sum(n + -1)
    }
  };
  sumX(sumX)
};
sum(10)
```

Unfortunately, this is an **infinite loop**!

We need to **delay** the evaluation of `sum` using the η-**expansion**:

$$e \quad \longrightarrow \quad \lambda x.e(x) \quad \text{only if} \quad x \text{ is } \textbf{NOT FREE} \text{ in } e.$$

Recursion without New Syntax in FAE

```
/* FAE + conditionals */
val sum = {
  val sumX = sumY => {
    val sum = x => sumY(sumY)(x);
    n => { // EXACTLY the same as the original body
      if (n < 1) 0
      else n + sum(n + -1)
    }
  };
  sumX(sumX)
};
sum(10)
```

Recursion without New Syntax in FAE

```
/* FAE + conditionals */
val sum = {
  val sumX = sumY => {
    val sum = x => sumY(sumY)(x);
    n => { // EXACTLY the same as the original body
      if (n < 1) 0
      else n + sum(n + -1)
    }
  };
  sumX(sumX)
};
sum(10)
```

Do we need to do this for every recursive function?

Recursion without New Syntax in FAE

```
/* FAE + conditionals */
val sum = {
  val sumX = sumY => {
    val sum = x => sumY(sumY)(x);
    n => { // EXACTLY the same as the original body
      if (n < 1) 0
      else n + sum(n + -1)
    }
  };
  sumX(sumX)
};
sum(10)
```

Do we need to do this for every recursive function?

To avoid such boilerplate code, let's define a helper function `mkRec`!

Recursion without New Syntax in FAE

```
/* FAE + conditionals */
val sum = {
  val fX = fY => {
    val sum = x => fY(fY)(x);
    n => {
      if (n < 1) 0
      else n + sum(n + -1)
    }
  };
  fX(fX)
};
sum(10)
```

First, we rename `sumX` and `sumY` to `fX` and `fY`, respectively.

Recursion without New Syntax in FAE

```
/* FAE + conditionals */
val sum = {
  val fX = fY => {
    val sum = x => fY(fY)(x);
    n => {
      if (n < 1) 0
      else n + sum(n + -1)
    }
  };
  fX(fX)
};
sum(10)
```

Then, let's desugar the inside variable definition `sum`.

Recursion without New Syntax in FAE

```
/* FAE + conditionals */
val sum = {
  val fX = fY => {
    (sum => n => {
      if (n < 1) 0
      else n + sum(n + -1)
    })(x => fY(fY)(x))
  };
  fX(fX)
};
sum(10)
```

Recursion without New Syntax in FAE

```
/* FAE + conditionals */
val sum = {
  val fX = fY => {
    (sum => n => {
      if (n < 1) 0
      else n + sum(n + -1)
    })(x => fY(fY)(x))
  };
  fX(fX)
};
sum(10)
```

Finally, let's define a helper function `mkRec` that takes a body of a recursive function and returns a recursive function.

mkRec: Helper Function for Recursion

```
/* FAE + conditionals */
val mkRec = body => {
  val fX = fY => body(x => fY(fY)(x))
  fX(fX)
};
val sum = mkRec(sum => n => {
  if (n < 1) 0
  else n + sum(n + -1)
});
sum(10)
```

mkRec: Helper Function for Recursion

```
/* FAE + conditionals */
val mkRec = body => {
  val fX = fY => body(x => fY(fY)(x))
  fX(fX)
};
val sum = mkRec(sum => n => {
  if (n < 1) 0
  else n + sum(n + -1)
});
sum(10)
```

Now, we can also define other recursive functions using `mkRec`.

`mkRec`: Helper Function for Recursion

```
/* FAE + conditionals */
val mkRec = body => {
  val fX = fY => body(x => fY(fY)(x))
  fX(fX)
};
val sum = mkRec(sum => n => {
  if (n < 1) 0
  else n + sum(n + -1)
});
sum(10)
```

Now, we can also define other recursive functions using `mkRec`. For example, the following recursive function `fac` computes the factorial:

```
/* FAE + conditionals */
val mkRec = ...;
val fac = mkRec(fac => n => if (n < 1) 1 else n * fac(n + -1));
fac(5) // 5 * 4 * 3 * 2 * 1 = 120
```

mkRec: Helper Function for Recursion

```
/* FAE + conditionals */
body => {
  val fX = fY => body(x => fY(fY)(x))
  fX(fX)
}
```

Its simplified version is as follows, and it is called the **Z combinator**:

```
/* FAE + conditionals */
f => (x => f(v => x(x)(v))) (x => f(v => x(x)(v)))
```

[2] https://en.wikipedia.org/wiki/Fixed-point_combinator

mkRec: Helper Function for Recursion

PLRG

```
/* FAE + conditionals */
body => {
  val fX = fY => body(x => fY(fY)(x))
  fX(fX)
}
```

Its simplified version is as follows, and it is called the **Z combinator**:

```
/* FAE + conditionals */
f => (x => f(v => x(x)(v))) (x => f(v => x(x)(v)))
```

There are other **fixed-point combinators**[2] such as the **Y combinator** used in non-strict languages without η-expansion:

```
/* non-strict languages */
f => (x => f(x(x))) (x => f(x(x)))
```

We will discuss non-strict (lazy) evaluation in the future.

RFAE – FAE with Recursion and Conditionals

The second way to support recursive functions in FAE is to extend FAE with **recursive function definitions**.

RFAE – FAE with Recursion and Conditionals

The second way to support recursive functions in FAE is to extend FAE with **recursive function definitions**.

RFAE is an extension of FAE with **recursion** and **conditionals**.

```
/* RFAE */
def sum(n) = if (n < 1) 0 else n + sum(n + -1);
sum(10) // 55
```

RFAE – FAE with Recursion and Conditionals

The second way to support recursive functions in FAE is to extend FAE with **recursive function definitions**.

RFAE is an extension of FAE with **recursion** and **conditionals**.

```
/* RFAE */
def sum(n) = if (n < 1) 0 else n + sum(n + -1);
sum(10) // 55
```

For RFAE, we need to extend **expressions** of FAE with

1. **arithmetic comparison operators**
2. **conditionals**
3. **recursive function definitions**

RFAE – FAE with Recursion and Conditionals

```
/* RFAE */
def sum(n) = if (n < 1) 0 else n + sum(n + -1);
sum(10) // 55
```

A **recursive function definition** consists of four parts:

- a function name
- a parameter name
- a function body expression
- a scope expression

RFAE – FAE with Recursion and Conditionals

```
/* RFAE */
def sum(n) = if (n < 1) 0 else n + sum(n + -1);
sum(10) // 55
```

A **recursive function definition** consists of four parts:

- a function name
- a parameter name
- a function body expression
- a scope expression

Note that a **recursive function definition** is also an expression can be used in any place where an expression is expected:

```
/* RFAE */
2 * {
  def sum(n) = if (n < 1) 0 else n + sum(n + -1);
  sum(10) // 55
} + 1 // 2 * 55 + 1 = 111
```

Concrete Syntax

```
// expressions
<expr> ::= ...
         | <expr> "<" <expr>
         | "if" "(" <expr> ")" <expr> "else" <expr>
         | "def" <id> "(" <id> ")" "=" <expr> ";" <expr>
```

For RFAE, we need to extend **expressions** of FAE with

1. **arithmetic comparison operators**
2. **conditionals**
3. **recursive function definitions**

Abstract Syntax

Let's define the **abstract syntax** of RFAE in BNF:

$$
\begin{array}{llll}
\text{Expressions} & \mathbb{E} \ni e ::= \ldots & & \\
& \mid e \; \texttt{<} \; e & & (\texttt{Lt}) \\
& \mid \texttt{if} \; (e) \; e \; \texttt{else} \; e & & (\texttt{If}) \\
& \mid \texttt{def} \; x(x) \; \texttt{=} \; e; \; e & & (\texttt{Rec})
\end{array}
$$

Abstract Syntax

PLRG

Let's define the **abstract syntax** of RFAE in BNF:

$$\text{Expressions} \quad \mathbb{E} \ni e ::= \ldots$$
$$\mid e \; \texttt{<} \; e \quad (\texttt{Lt})$$
$$\mid \texttt{if} \; (e) \; e \; \texttt{else} \; e \quad (\texttt{If})$$
$$\mid \texttt{def} \; x(x) \; \texttt{=} \; e; \; e \quad (\texttt{Rec})$$

```
enum Expr:
  ...
  // less-than
  case Lt(left: Expr, right: Expr)
  // conditionals
  case If(cond: Expr, thenExpr: Expr, elseExpr: Expr)
  // recursive function definition
  case Rec(name: String, param: String, body: Expr, scope: Expr)
```

Contents

Now, let's 1) implement the **interpreter**:

```
def interp(expr: Expr, env: Env): Value = ???
```

and 2) define the **natural semantics** for **recursive function definitions** and other new cases.

$$\boxed{\sigma \vdash e \Rightarrow v}$$

$$
\begin{array}{llrll}
\text{Expressions} & \mathbb{E} \ni e ::= & \ldots & & \\
& & | & e \;\texttt{<}\; e & (\texttt{Lt}) \\
& & | & \texttt{if}\;(e)\;e\;\texttt{else}\;e & (\texttt{If}) \\
& & | & \texttt{def}\;x(x)\;\texttt{=}\;e;\;e & (\texttt{Rec}) \\
\text{Values} & \mathbb{V} \ni v ::= & & n \mid b \mid \langle \lambda x.e, \sigma \rangle &
\end{array}
$$

```
enum Value:
  case NumV(number: BigInt)
  case BoolV(bool: Boolean)
  case CloV(param: String, body: Expr, env: Env)
```

Arithmetic Comparison Operators

```scala
type BOp[T] = (T, T) => T
type COp[T] = (T, T) => Boolean
def numCOp(op: COp[BigInt], x: String): BOp[Value] =
  case (NumV(l), NumV(r)) => BoolV(op(l, r))
  case (l, r) => error(s"invalid operation: ${l.str} $x ${r.str}")

val numLt: BOp[Value] = numCOp(_ < _, "<")

def interp(expr: Expr, env: Env): Value = expr match
  ...
  case Lt(l, r) => numLt(interp(l, env), interp(r, env))
```

$$\boxed{\sigma \vdash e \Rightarrow v}$$

$$\text{Lt}\ \frac{\sigma \vdash e_1 \Rightarrow n_1 \qquad \sigma \vdash e_2 \Rightarrow n_2}{\sigma \vdash e_1 \texttt{<} e_2 \Rightarrow n_1 < n_2}$$

Conditionals

```scala
def interp(expr: Expr, env: Env): Value = expr match
  ...
  case If(c, t, e) => interp(c, env) match
    case BoolV(true)  => interp(t, env)
    case BoolV(false) => interp(e, env)
    case v            => error(s"not a boolean: ${v.str}")
```

$$\boxed{\sigma \vdash e \Rightarrow v}$$

$$\texttt{If}_T \ \frac{\sigma \vdash e_0 \Rightarrow \texttt{true} \qquad \sigma \vdash e_1 \Rightarrow v_1}{\sigma \vdash \texttt{if}\ (e_0)\ e_1\ \texttt{else}\ e_2 \Rightarrow v_1}$$

$$\texttt{If}_F \ \frac{\sigma \vdash e_0 \Rightarrow \texttt{false} \qquad \sigma \vdash e_2 \Rightarrow v_2}{\sigma \vdash \texttt{if}\ (e_0)\ e_1\ \texttt{else}\ e_2 \Rightarrow v_2}$$

Recursive Function Definitions

```
def interp(expr: Expr, env: Env): Value = expr match
  ...
  case Rec(n, p, b, s) =>
    val newEnv: Env = ???
    interp(s, newEnv)
```

$$\boxed{\sigma \vdash e \Rightarrow v}$$

$$\texttt{Rec}\ \frac{\sigma' = \texttt{???} \qquad \sigma' \vdash e_3 \Rightarrow v_3}{\sigma \vdash \texttt{def}\ x_0(x_1)\ \texttt{=}\ e_2; e_3 \Rightarrow v_3}$$

Recursive Function Definitions

PLRG

```
def interp(expr: Expr, env: Env): Value = expr match
  ...
  case Rec(n, p, b, s) =>
    val newEnv: Env = env + (n -> CloV(p, b, ???))
    interp(s, newEnv)
```

$$\boxed{\sigma \vdash e \Rightarrow v}$$

$$\texttt{Rec}\ \frac{\sigma' = \sigma[x_0 \mapsto \langle \lambda x_1.e_2, ???\rangle] \qquad \sigma' \vdash e_3 \Rightarrow v_3}{\sigma \vdash \texttt{def}\ x_0(x_1)\ \texttt{=}\ e_2; e_3 \Rightarrow v_3}$$

Recursive Function Definitions

```
def interp(expr: Expr, env: Env): Value = expr match
  ...
  case Rec(n, p, b, s) =>
    val newEnv: Env = env + (n -> CloV(p, b, newEnv)) // not working
    interp(s, newEnv)
```

$$\boxed{\sigma \vdash e \Rightarrow v}$$

$$\texttt{Rec}\ \frac{\sigma' = \sigma[x_0 \mapsto \langle \lambda x_1.e_2, \sigma' \rangle] \qquad \sigma' \vdash e_3 \Rightarrow v_3}{\sigma \vdash \texttt{def}\ x_0(x_1)\ \texttt{=}\ e_2; e_3 \Rightarrow v_3}$$

Recursive Function Definitions

```
def interp(expr: Expr, env: Env): Value = expr match
  ...
  case Rec(n, p, b, s) =>
    val newEnv: Env = env + (n -> CloV(p, b, newEnv)) // not working
    interp(s, newEnv)
```

$$\boxed{\sigma \vdash e \Rightarrow v}$$

$$\texttt{Rec}\ \frac{\sigma' = \sigma[x_0 \mapsto \langle \lambda x_1.e_2, \sigma' \rangle] \qquad \sigma' \vdash e_3 \Rightarrow v_3}{\sigma \vdash \texttt{def}\ x_0(x_1)\ \texttt{=}\ e_2; e_3 \Rightarrow v_3}$$

While it makes sense in the natural semantics, the above Scala code doesn't work because `newEnv` is not yet defined.

Recursive Function Definitions

```
def interp(expr: Expr, env: Env): Value = expr match
  ...
  case Rec(n, p, b, s) =>
    val newEnv: Env = env + (n -> CloV(p, b, newEnv)) // not working
    interp(s, newEnv)
```

$$\boxed{\sigma \vdash e \Rightarrow v}$$

$$\texttt{Rec}\ \frac{\sigma' = \sigma[x_0 \mapsto \langle \lambda x_1.e_2, \sigma' \rangle] \qquad \sigma' \vdash e_3 \Rightarrow v_3}{\sigma \vdash \texttt{def}\ x_0(x_1)\ \texttt{=}\ e_2; e_3 \Rightarrow v_3}$$

While it makes sense in the natural semantics, the above Scala code doesn't work because `newEnv` is not yet defined.

Let's **delay** the evaluation of `newEnv` using the η-**expansion** again:

$$e \quad \longrightarrow \quad \lambda x.e(x) \quad \text{only if} \quad x \text{ is } \textbf{NOT FREE} \text{ in } e.$$

Recursive Function Definitions

We augment the closure value with an **environment factory** (`() => Env`) rather than an **environment** (`Env`):

```
enum Value:
  ...
  case CloV(param: String, body: Expr, env: () => Env)

def interp(expr: Expr, env: Env): Value = expr match
  ...
  case Func(p, b) => CloV(p, b, () => env)
  case App(f, e) => interp(f, env) match
    case CloV(p, b, fenv) => interp(b, fenv() + (p -> interp(e, env)))
    case v                => error(s"not a function: ${v.str}")
  case Rec(n, p, b, s) =>
    val newEnv: Env = env + (n -> CloV(p, b, () => newEnv)) // error
    interp(s, newEnv)
```

It sill doesn't work because `newEnv` is not yet defined.

Let's use a **lazy value** (`lazy val`) to delay the evaluation of `newEnv`.

Recursive Function Definitions

PLRG

```
def interp(expr: Expr, env: Env): Value = expr match
  ...
  case Rec(n, p, b, s) =>
    lazy val newEnv: Env = env + (n -> CloV(p, b, () => newEnv))
    interp(s, newEnv)
```

$$\boxed{\sigma \vdash e \Rightarrow v}$$

$$\texttt{Rec}\ \frac{\sigma' = \sigma[x_0 \mapsto \langle \lambda x_1.e_2, \sigma' \rangle] \qquad \sigma' \vdash e_3 \Rightarrow v_3}{\sigma \vdash \texttt{def}\ x_0(x_1)\ \texttt{=}\ e_2; e_3 \Rightarrow v_3}$$

We will learn more about **lazy values** in the later lectures in this course.

Exercise #5

https://github.com/ku-plrg-classroom/docs/tree/main/cose212/rfae

- Please see above document on GitHub:
  - Implement `interp` function.
- It is just an exercise, and you **don't need to submit** anything.
- However, some exam questions might be related to this exercise.

Summary

1. Recursion and Conditionals
   - Recursion in F1VAE
   - Recursion in FAE
2. Recursion without New Syntax in FAE
   - `mkRec`: Helper Function for Recursion
3. RFAE – FAE with Recursion and Conditionals
   - Concrete Syntax
   - Abstract Syntax
4. Interpreter and Natural Semantics for RFAE
   - Interpreter and Natural Semantics
   - Arithmetic Comparison Operators
   - Conditionals
   - Recursive Function Definitions

Next Lecture

- Mutable Data Structures
