Lecture 22 – Examples of Turing Machines COSE215: Theory of Computation

Jihyeok Park

2025 Spring

- A Turing machine (TM) is a deterministic FA with a tape.
 - **1** A **tape** is an infinite sequence of cells containing **tape symbols**. (The **blank symbol** *B* is a special symbol representing an empty cell.)
 - 2 A tape head points to the current cell.
 - A transition performs the following operations depending on the current 1) state and 2) tape symbol pointed by the tape head:
 - Change the current state.
 - Replace the current tape symbol pointed by the tape head.
 - Move the tape head left or right.
- We can use Turing machines as computing machines.
