Mutable Variables

A **mutable variable** is a variable whose value can be changed after its initialization.

Mutable Variables

A **mutable variable** is a variable whose value can be changed after its initialization.

Let's define mutable variables in Scala:

```
// A mutable variable `x` of type `Int` with 1
var x: Tnt = 1
// We can reassign a mutable variable `x`
x = 2
            // x == 2
x + 2
             //2 + 2 == 4 : Int
// The function `f` is impure because it uses a mutable variable `y`
var y: Int = 1
def f(x: Int): Int = x + y
f(5)
       //5 + 1 == 6 : Int.
v = 3
f(5)
             // 5 + 3 == 8 : Int
```

Now, let's extend FAE into MFAE to support **mutable variables**.

```
/* MFAE */
var x = 5;
x;  // 5
x = 8;
x  // 8
```

```
/* MFAE */
var y = 1;
var f = x => { x = x + y; x * x };
f(5); // (5 + 1) * (5 + 1) = 36
y = 3;
f(5); // (5 + 3) * (5 + 3) = 64
```

For MFAE, we need to extend expressions of FAE with

- mutable variables (var) rather than immutable variables (val)
 (all variables, including parameters, are mutable in MFAE)
- **2** assignment (=) (right-associative: e.g., x = y = e is equivalent to x = (y = e))
- **3 sequence** of expressions

Concrete Syntax

For MFAE, we need to extend expressions of FAE with

- mutable variables (var) rather than immutable variables (val) (all variables, including parameters, are mutable in MFAE)
- 2 assignment (=) (right-associative: e.g., x=y=e is equivalent to x=(y=e))
- 3 sequence of expressions

Let's define the **abstract syntax** of MFAE in BNF:

```
enum Expr:
...
// mutable variable definition
case Var(name: String, init: Expr, body: Expr)
// variable assignment
case Assign(name: String, expr: Expr)
// sequence
case Seq(left: Expr, right: Expr)
```

4. Call-by-Value vs. Call-by-Reference

Evaluation with Memories

We can represent mutable variables by assigning different **addresses** to each variable in the environment and storing their values in the **memory**.

We can represent mutable variables by assigning different **addresses** to each variable in the environment and storing their values in the **memory**.

Let's see how to evaluate the following MFAE expression:

```
/* MFAE */
var x = 5;
x;
x = 8;
x
```

We can represent mutable variables by assigning different **addresses** to each variable in the environment and storing their values in the **memory**.

Let's see how to evaluate the following MFAE expression:

```
/* MFAE */
var x = 5;
x;
x = 8;
x
```

Evaluation with Memories

We can represent mutable variables by assigning different **addresses** to each variable in the environment and storing their values in the **memory**.

Let's see how to evaluate the following MFAE expression:

 $\sigma = [$

Evaluation with Memories

We can represent mutable variables by assigning different **addresses** to each variable in the environment and storing their values in the **memory**.

Let's see how to evaluate the following MFAE expression:

```
/* MFAE */
var x = 5;
x; /* 5 */
x = 8;
x
```

 $\sigma = [$

We can represent mutable variables by assigning different **addresses** to each variable in the environment and storing their values in the **memory**.

Let's see how to evaluate the following MFAE expression:

```
\sigma = \begin{bmatrix} & & & \\ & \mathbf{x} \mapsto a_0 & & \\ & & \end{bmatrix}
A : a_0 \quad a_1 \quad a_2 \quad a_3 \quad \dots
M = \begin{bmatrix} 8 & & & & \\ & & & & \\ \end{bmatrix} \quad \dots
```

```
/* MFAE */
var y = 1;
var f = x => {
    x = x + y;
    x * x
};
f(5);
y = 3;
f(5);
```

```
/* MFAE */
var y = 1;
var f = x => {
  x = x + y;
  x * x
};
f(5);
y = 3;
f(5);
```

```
\sigma = \begin{bmatrix} \\ y \mapsto a_0 \end{bmatrix}
A : a_0 \ a_1 \ a_2 \ a_3 \ \dots
M = \boxed{1} \ \boxed{\dots}
```

```
/* MFAE */
var y = 1;
var f = x => {
    x = x + y;
    x * x
};
f(5);
y = 3;
f(5);
```

```
\sigma = \begin{bmatrix} & & & & \\ & y \mapsto a_0 & & \\ & f \mapsto a_1 & & \\ \end{bmatrix}
A : a_0 \quad a_1 \quad a_2 \quad a_3 \quad \dots
M = \begin{bmatrix} 1 & v & & & \dots \end{bmatrix}
```

where
$$v = \langle \lambda \mathbf{x}.(\mathbf{x} = \mathbf{x} + \mathbf{y}; \mathbf{x} * \mathbf{x}), [\mathbf{y} \mapsto a_0] \rangle$$

```
/* MFAE */
var y = 1;
var f = x => {
    x = x + y;
    x * x
};
f(5);
y = 3;
f(5);
```

```
\sigma = \begin{bmatrix} & & & & \\ & \mathbf{y} \mapsto a_0 & & \\ & \mathbf{x} \mapsto a_2 & & \\ \end{bmatrix} A \quad : \quad a_0 \quad a_1 \quad a_2 \quad a_3 \quad \dots M \quad = \begin{bmatrix} 1 & v & 5 & & \dots \end{bmatrix}
```

where
$$v = \langle \lambda \mathbf{x}.(\mathbf{x} = \mathbf{x} + \mathbf{y}; \mathbf{x} * \mathbf{x}), [\mathbf{y} \mapsto a_0] \rangle$$

```
/* MFAE */
var y = 1;
var f = x => {
    x = x + y; /* 5 + 1 */ *
    x * x
};
f(5);
y = 3;
f(5);
```

```
\sigma = \begin{bmatrix} & & & & \\ & y \mapsto a_0 & & \\ & x \mapsto a_2 & & \\ \end{bmatrix}
A : a_0 \quad a_1 \quad a_2 \quad a_3 \quad \dots
M = \begin{bmatrix} 1 & v & 6 & & \dots \end{bmatrix}
```

where
$$v = \langle \lambda \mathbf{x}.(\mathbf{x} = \mathbf{x} + \mathbf{y}; \mathbf{x} * \mathbf{x}), [\mathbf{y} \mapsto a_0] \rangle$$

```
\sigma = \begin{bmatrix} y \mapsto a_0 \\ x \mapsto a_2 \end{bmatrix}
A : a_0 \quad a_1 \quad a_2 \quad a_3 \quad \dots
M = \boxed{1 \quad v \quad 6 \quad \dots}
```

where
$$v = \langle \lambda \mathbf{x}.(\mathbf{x} = \mathbf{x} + \mathbf{y}; \mathbf{x} * \mathbf{x}), [\mathbf{y} \mapsto a_0] \rangle$$

```
/* MFAE */
var y = 1;
var f = x => {
    x = x + y;
    x * x
};
f(5);    /* 36 */ *
y = 3;
f(5);
```

```
\sigma = \begin{bmatrix} & & & \\ & \mathbf{y} \mapsto a_0 & \\ & \mathbf{f} \mapsto a_1 & \\ \end{bmatrix}
\mathbb{A} : a_0 \quad a_1 \quad a_2 \quad a_3 \quad \dots
M = \begin{bmatrix} 1 & v & 6 & & \dots \end{bmatrix}
```

where
$$v = \langle \lambda \mathbf{x}.(\mathbf{x} = \mathbf{x} + \mathbf{y}; \mathbf{x} * \mathbf{x}), [\mathbf{y} \mapsto a_0] \rangle$$

```
/* MFAE */
var y = 1;
var f = x => {
    x = x + y;
    x * x
};
f(5);    /* 36 */
y = 3;
f(5);
```

```
\sigma = \begin{bmatrix} & & & \\ & y \mapsto a_0 & \\ & f \mapsto a_1 & \\ & \end{bmatrix}
A : a_0 \quad a_1 \quad a_2 \quad a_3 \quad \dots
M = \begin{bmatrix} 3 & v & 6 & & \dots \end{bmatrix}
```

where
$$v = \langle \lambda \mathbf{x}.(\mathbf{x} = \mathbf{x} + \mathbf{y}; \mathbf{x} * \mathbf{x}), [\mathbf{y} \mapsto a_0] \rangle$$

```
/* MFAE */
var y = 1;
var f = x => {
    x = x + y;
    x * x
};
f(5);    /* 36 */
y = 3;
f(5);
```

```
\sigma = \begin{bmatrix} & & & & \\ & \mathbf{y} \mapsto a_0 & & \\ & \mathbf{x} \mapsto a_3 & & \\ \end{bmatrix}
A : a_0 \ a_1 \ a_2 \ a_3 \ \dots
M = \begin{bmatrix} 3 & v & 6 & 5 & \dots \end{bmatrix}
```

where
$$v = \langle \lambda \mathbf{x}.(\mathbf{x} = \mathbf{x} + \mathbf{y}; \mathbf{x} * \mathbf{x}), [\mathbf{y} \mapsto a_0] \rangle$$

```
/* MFAE */
var y = 1;
var f = x => {
    x = x + y; /* 5 + 3 */
    x * x
};
f(5); /* 36 */
y = 3;
f(5);
```

```
\sigma = \begin{bmatrix} y \mapsto a_0 \\ x \mapsto a_3 \end{bmatrix}
A : a_0 \quad a_1 \quad a_2 \quad a_3 \quad \dots
M = \boxed{3 \quad v \quad 6 \quad 8 \quad \dots}
```

where
$$v = \langle \lambda \mathbf{x}.(\mathbf{x} = \mathbf{x} + \mathbf{y}; \mathbf{x} * \mathbf{x}), [\mathbf{y} \mapsto a_0] \rangle$$

```
\sigma = \begin{bmatrix} y \mapsto a_0 \\ x \mapsto a_3 \end{bmatrix}
A : a_0 \quad a_1 \quad a_2 \quad a_3 \quad \dots
M = \boxed{3 \quad v \quad 6 \quad 8 \quad \dots}
```

where
$$v = \langle \lambda \mathbf{x}.(\mathbf{x} = \mathbf{x} + \mathbf{y}; \mathbf{x} * \mathbf{x}), [\mathbf{y} \mapsto a_0] \rangle$$

```
/* MFAE */
var y = 1;
var f = x => {
    x = x + y;
    x * x
};
f(5);    /* 36 */
y = 3;
f(5);    /* 64 */
*
```

```
\sigma = \begin{bmatrix} y \mapsto a_0 \\ f \mapsto a_1 \end{bmatrix}
A : a_0 \quad a_1 \quad a_2 \quad a_3 \quad \dots
M = \boxed{3 \quad v \quad 6 \quad 8 \quad \dots}
```

where
$$v = \langle \lambda \mathbf{x}.(\mathbf{x} = \mathbf{x} + \mathbf{y}; \mathbf{x} * \mathbf{x}), [\mathbf{y} \mapsto a_0] \rangle$$

For MFAE, we need to 1) implement the **interpreter** with environments and **memories** by passing the updated memory in the result:

```
def interp(expr: Expr, env: Env, mem: Mem): (Value, Mem) = ???
```

```
type Env = Map[String, Addr]
type Addr = Int
type Mem = Map[Addr, Value]
```

```
enum Value:
   case NumV(n: BigInt)
   case CloV(p: String, b: Expr, e: Env)
```

For MFAE, we need to 1) implement the **interpreter** with environments and **memories** by passing the updated memory in the result:

```
def interp(expr: Expr, env: Env, mem: Mem): (Value, Mem) = ???
```

```
type Env = Map[String, Addr]
type Addr = Int
type Mem = Map[Addr, Value]
enum Value:
    case NumV(n: BigInt)
    case CloV(p: String, b: Expr, e: Env)
```

and 2) define the **natural semantics** with environments and **memories** by passing the updated memory in the result:

$$\sigma, M \vdash e \Rightarrow v, M$$

$$\begin{array}{lll} {\sf Environments} & \sigma & \in \, \mathbb{X} \xrightarrow{\sf fin} \, \mathbb{A} & ({\tt Env}) \\ {\sf Addresses} & a & \in \, \mathbb{A} & ({\tt Addr}) \\ {\sf Memories} & M & \in \, \mathbb{A} \xrightarrow{\sf fin} \, \mathbb{V} & ({\tt Mem}) \end{array}$$

Mutable Variable

```
def interp(expr: Expr, env: Env, mem: Mem): (Value, Mem) = expr match
...
    case Var(name, init, body) =>
      val (iv, imem) = interp(init, env, mem)
    val addr = malloc(imem)
    interp(body, env + (name -> addr), imem + (addr -> iv))
```

$$\sigma, M \vdash e \Rightarrow v, M$$

$$\operatorname{Var} \frac{ \begin{matrix} \sigma, M \vdash e_1 \Rightarrow v_1, M_1 \\ \sigma[x \mapsto a], M_1[a \mapsto v_1] \vdash e_2 \Rightarrow v_2, M_2 \end{matrix} }{ \sigma, M \vdash \operatorname{var} \ x = e_1; \ e_2 \Rightarrow v_2, M_2 }$$

We learned one way to implement malloc in the previous lecture:

```
def malloc(mem: Mem): Addr = mem.keySet.maxOption.fold(0)(_ + 1)
```

Identifier Lookup

```
def interp(expr: Expr, env: Env, mem: Mem): (Value, Mem) = expr match
    ...
    case Id(name) => (mem(lookupId(env, name)), mem)

def lookupId(env: Env, name: String): Addr =
    env.getOrElse(name, error(s"free identifier: $name"))
```

$$\sigma, M \vdash e \Rightarrow v, M$$

$$\operatorname{Id} \frac{x \in \operatorname{Domain}(\sigma)}{\sigma, M \vdash x \Rightarrow M(\sigma(x)), M}$$

Function Application

```
def interp(expr: Expr, env: Env, mem: Mem): (Value, Mem) = expr match
...
  case App(fun, arg) =>
    val (fv, fmem) = interp(fun, env, mem)
    fv match
      case CloV(param, body, fenv) =>
        val (av, amem) = interp(arg, env, fmem)
      val addr = malloc(amem)
      interp(body, fenv + (param -> addr), amem + (addr -> av))
      case _ =>
        error(s"not a function: ${fv.str}")
```

$$\sigma, M \vdash e \Rightarrow v, M$$

$$\operatorname{App} \frac{ \begin{matrix} \sigma, M \vdash e_1 \Rightarrow \langle \lambda x. e_3, \sigma' \rangle, M_1 & \sigma, M_1 \vdash e_2 \Rightarrow v_2, M_2 \\ a \notin \operatorname{Domain}(M_2) & \sigma'[x \mapsto a], M_2[a \mapsto v_2] \vdash e_3 \Rightarrow v_3, M_3 \\ \hline \sigma, M \vdash e_1(e_2) \Rightarrow v_3, M_3 \end{matrix}$$

Assignment

```
def interp(expr: Expr, env: Env, mem: Mem): (Value, Mem) = expr match
    ...
    case Assign(name, expr) =>
      val (ev, emem) = interp(expr, env, mem)
      (ev, emem + (lookupId(env, name) -> ev))
```

$$\sigma, M \vdash e \Rightarrow v, M$$

$$\texttt{Assign} \ \frac{\sigma, M \vdash e \Rightarrow v, M' \qquad x \in \mathsf{Domain}(\sigma)}{\sigma, M \vdash x = e \Rightarrow v, M'[\sigma(x) \mapsto v]}$$

4. Call-by-Value vs. Call-by-Reference

The current semantics of MFAE is based on the **call-by-value (CBV)** evaluation strategy, because the argument expression is always evaluated and the result **value** is passed to the parameter.

The current semantics of MFAE is based on the **call-by-value (CBV)** evaluation strategy, because the argument expression is always evaluated and the result **value** is passed to the parameter.

The current semantics of MFAE is based on the call-by-value (CBV) evaluation strategy, because the argument expression is always evaluated and the result value is passed to the parameter.

However, we can define the semantics of MFAE in another way by using the call-by-reference (CBR) evaluation strategy instead; if the argument expression is an identifier, the parameter points to its address.

```
\sigma = |
    f \mapsto \langle \lambda x.(\ldots), \varnothing \rangle,
     a \mapsto a_0, b \mapsto a_1,
                                       a_3
```

```
a_{4}
```

```
/* MFAF */
var f = x \Rightarrow y \Rightarrow \{
 var t = x:
var a = 1;
var b = 2:
f(a)(b); a; b
```

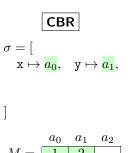

CBK			
$\sigma = [\\ \mathbf{f} \mapsto \\ \mathbf{a} \mapsto$			
]			
	a_0	a_1	a_2
7.1 I	1	2	

CBB

The current semantics of MFAE is based on the **call-by-value (CBV)** evaluation strategy, because the argument expression is always evaluated and the result **value** is passed to the parameter.

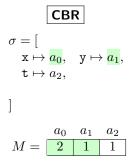

```
/* MFAE */
var f = x => y => { *
    var t = x;
    x = y;
    y = t;
};
var a = 1;
var b = 2;
f(a)(b); a; b
```

The current semantics of MFAE is based on the **call-by-value (CBV)** evaluation strategy, because the argument expression is always evaluated and the result **value** is passed to the parameter.

```
/* MFAE */
var f = x => y => {
  var t = x;
  x = y;
  y = t;
};
var a = 1;
var b = 2;
f(a)(b); a; b
```

The current semantics of MFAE is based on the **call-by-value (CBV)** evaluation strategy, because the argument expression is always evaluated and the result **value** is passed to the parameter.

```
\begin{array}{c}
\textbf{CBV} \\
\sigma = [\\
\mathbf{f} \mapsto \langle \lambda \mathbf{x}.(\ldots), \varnothing \rangle, \\
\mathbf{a} \mapsto a_0, \quad \mathbf{b} \mapsto a_1,
\end{array}
```

```
/* MFAE */
var f = x => y => {
  var t = x;
  x = y;
  y = t;
};
var a = 1;
var b = 2;
f(a)(b); a; b
```

```
 \begin{array}{c} \left\lceil \mathsf{CBR} \right\rceil \\ \sigma = [ \\ \text{f} \mapsto \langle \lambda \mathtt{x}.(\ldots), \varnothing \rangle, \\ \mathtt{a} \mapsto a_0, \quad \mathtt{b} \mapsto a_1, \\ \\ \end{bmatrix} \\ M = \begin{array}{c|c} a_0 & a_1 & a_2 \\ \hline 2 & 1 & 1 \end{array}
```

We can define the semantics of MFAE with the **call-by-reference (CBR)** evaluation strategy by adding the following case:

```
def interp(expr: Expr, env: Env, mem: Mem): (Value, Mem) = expr match
  case App(fun, arg) =>
    val (fv, fmem) = interp(fun, env, mem)
    fy match
      case CloV(param, body, fenv) => arg match
        case Id(name) =>
          val addr = lookupId(env, name)
          interp(body, fenv + (param -> addr), fmem)
        case _ => ...
      case _ => error(s"not a function: ${fv.str}")
    . . .
```

$$\operatorname{App}_x \frac{\sigma, M \vdash e_1 \Rightarrow \langle \lambda x'. e_2, \sigma' \rangle, M_1}{\sigma'[x' \mapsto \sigma(x)], M_1 \vdash e_2 \Rightarrow v_2, M_2}{\sigma, M \vdash e_1(x) \Rightarrow v_2, M_2}$$

Exercise #7

https://github.com/ku-plrg-classroom/docs/tree/main/cose212/mfae

- Please see above document on GitHub:
 - Implement interp function.
 - Implement interpCBR function.
- It is just an exercise, and you don't need to submit anything.
- However, some exam questions might be related to this exercise.
